

# WEATHER WATCH

## OUTLOOK FOR THE VENTURA VALLEY AREAS

Prepared by WeatherAg Chief Meteorologist

**DATE: 03/15/2019**

### ▼ FORECAST SYNOPSIS ▼

The 2018-19 Weather Watch season will end today (forecast season runs Nov 15-Mar 15). There have been some challenges in this second year of the Ventura region program, due to the very limited available weather station data. Nonetheless, we hope you have found these forecasts to be beneficial to your operation and look forward to doing this again for the 2019-20 forecast season. Please remember to thank Sinclair! Sponsors are needed for next season, contact Joel Reyes at California Citrus Mutual with any ideas.

Low temperatures will continue to stay well above 32-degrees for at least the next 7-10 days. Breezy to windy conditions can be expected over the next couple of days, with gusts up to 30-40 mph at times in spots and will affect forecast temperatures. Expect mainly clear skies with just a passing cloud here and there through the weekend.

A warming trend will continue today and peak on Sunday or Monday. Highs today will be around 70 to the low and mid 70's. Dry weather will prevail through Monday, then shower chances increase on late Tuesday through Wednesday. This will be a relatively warm storm so no threat of freezing lows after the storm passes.

**Please be sure to thank Sinclair  
for making the Ventura region frost/freeze weather watch program possible.**

As a reminder, this program is setup as a frost and freeze forecast for the night of the date listed.

**Wind concerns during possible frost/freeze: n/a**

**Approx Duration of Subfreezing Conditions: n/a**

### SPECIFIC LOCATION FROST-FREEZE FORECAST

<u>Station Name</u>	Tonight's Forecast LOWS	1. Forecast accurate as of time of issuance. 2. Low temperature forecast spread during non-critical days is five degrees. When a frost or freeze is expected, the forecast spread is three degrees.
